The lake is around 230m deep and contains many species of fishes, as well as being home to birds and other wildlife. A smaller volcanic cone, Gunung Baru Jari, was formed a couple of hundred years ago from the crater's interior at the edge of the lake. It has been estimated that the force needed to create the new cone and the lake would have been equaled to around 300 Hiroshima-type atomic bombs. There are several springs located around the volcano, most importantly 'Aik Kalak' on the northeast of the crater, where the volcanically-heated waters are said to cure illnesses, particularly skin diseases.
